L6 ANSWER 1 OF 2 USPATFULL on STN

AB The invention is an improved apparatus for producing monocrystalline
bodies of alumina (or other materials) that are characterized by varying
cross-sections, for example, a sapphire tube having an internal flange.
The apparatus comprises a novel die arrangement adapted to support a
thin film of melt from which the crystalline body is grown, the die
being adjustable to change the configuration of the film and thereby
vary the shape of the body being grown.
